

Microwave Characterization of Liquids with Resonant Methods

Bartłomiej Salski¹, Marzena Olszewska-Placha² and Piotr Czekala¹

¹Warsaw University of Technology, Warsaw, Poland

²QWED Sp. z o.o., Warsaw, Poland

Outline

- Motivation
- Measurement techniques
 - Cavity resonators
 - New Fabry-Perot open resonator
- Measurement results
- Temperature dependent measurements
- Summary

Motivation

- Dielectric characterization of “loose” materials
 - Liquids
 - Powders
- Electronic coolants
- Food industry
- Raw materials producers
- Characterization with resonant methods
- Wideband characterization in 1 – 50 GHz
 - Cavity devices
 - Fabry-Perot Open Resonator

Materials characterization (1)

- Resonant methods well established for materials characterization
- International initiatives benchmarking existing materials characterization methods (iNEMI: www.inemi.org)
- Resonant methods are proven to be the most accurate among microwave material characterisation methods

Family of Split-Post Dielectric Resonators

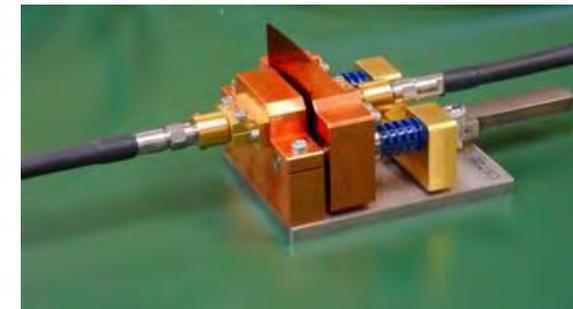

Fabry-Perot Open Resonator

Split-Cavity Resonator

Balanced Circular Disk Resonator

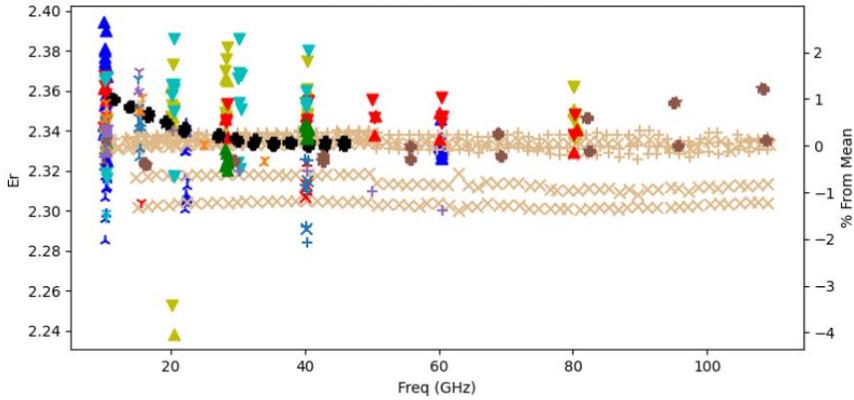

Materials characterization (2)

INEMI 5G/mmWave Materials Assessment and Characterization project results

Over 1000 measurement points in total

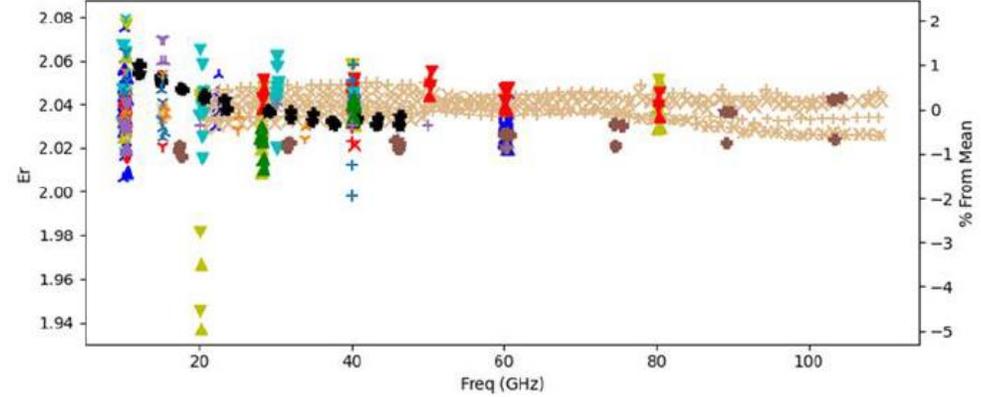

Round 1

All COP Measurements

Spread of Dk: $\pm 2\%$

Measurement methods (1)

Resonant methods are proven to be the most accurate among microwave material characterisation methods

Low frequency dielectric resonator cavities

Schematic concept of the dielectric resonator cavity

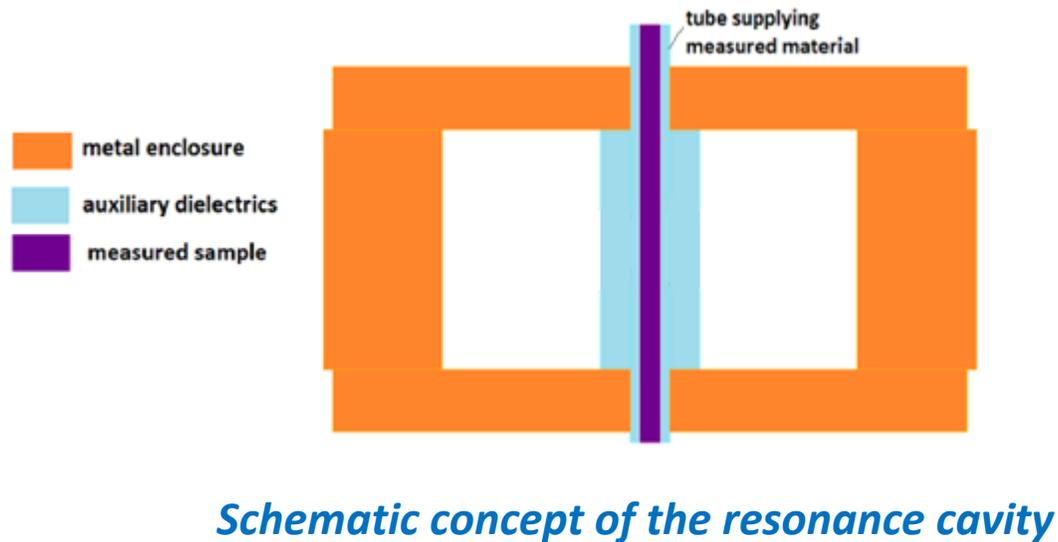

Dielectric resonator cavity at 1 GHz

Measurement methods (2)

Resonant methods are proven to be the most accurate among microwave material characterisation methods

Higher frequency cavity resonators

24-GHz Cavity resonator

(with fused silica tube, rubber tube and syringe)

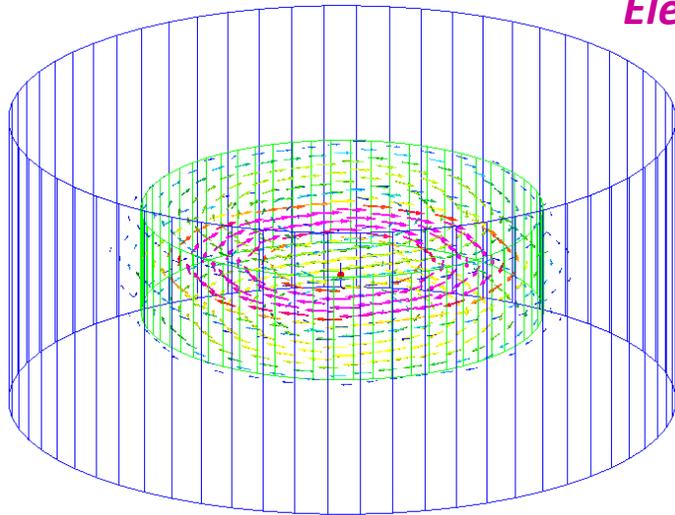

Measurement methods (3)

- $TE_{01\delta}$ resonance mode (described with resonant frequency and Q-factor)
- Electric field mostly confined within the dielectric pill
- Circumferential electric field
 - no issues with galvanic connection of the lid
- Zero electric field at $\rho=0$
 - no risk of suppressing resonance if lossy sample is inserted

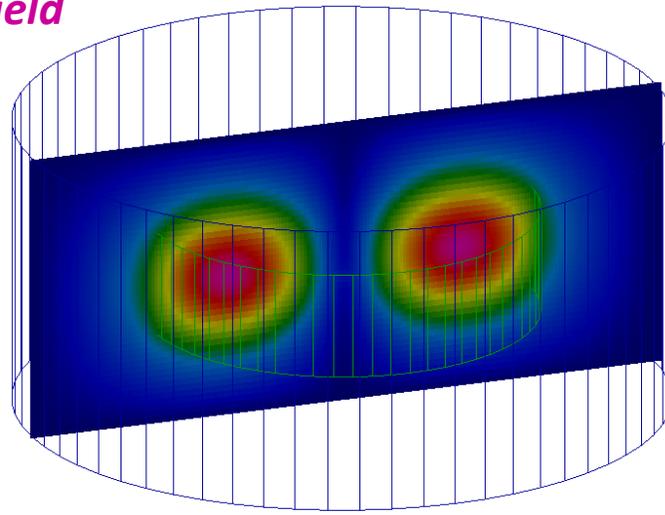

Resonance mode within dielectric resonator cavity *

Electric field

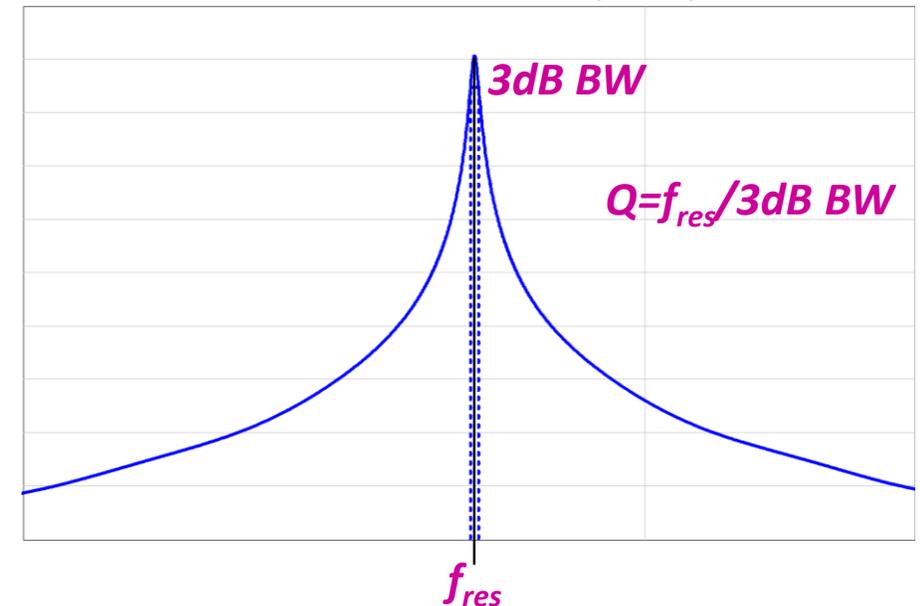

Vector view

Amplitude view (cross section)

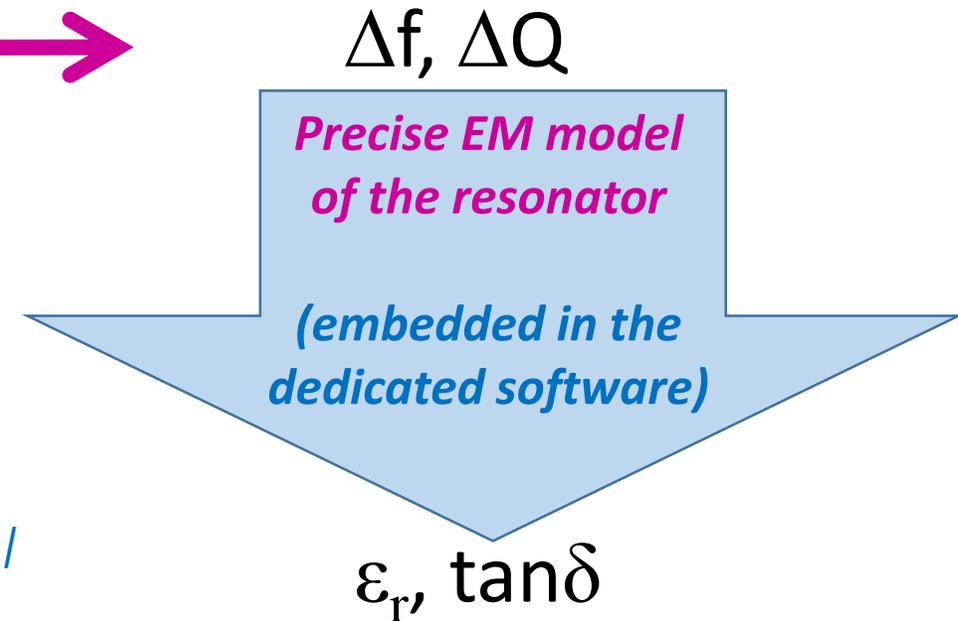

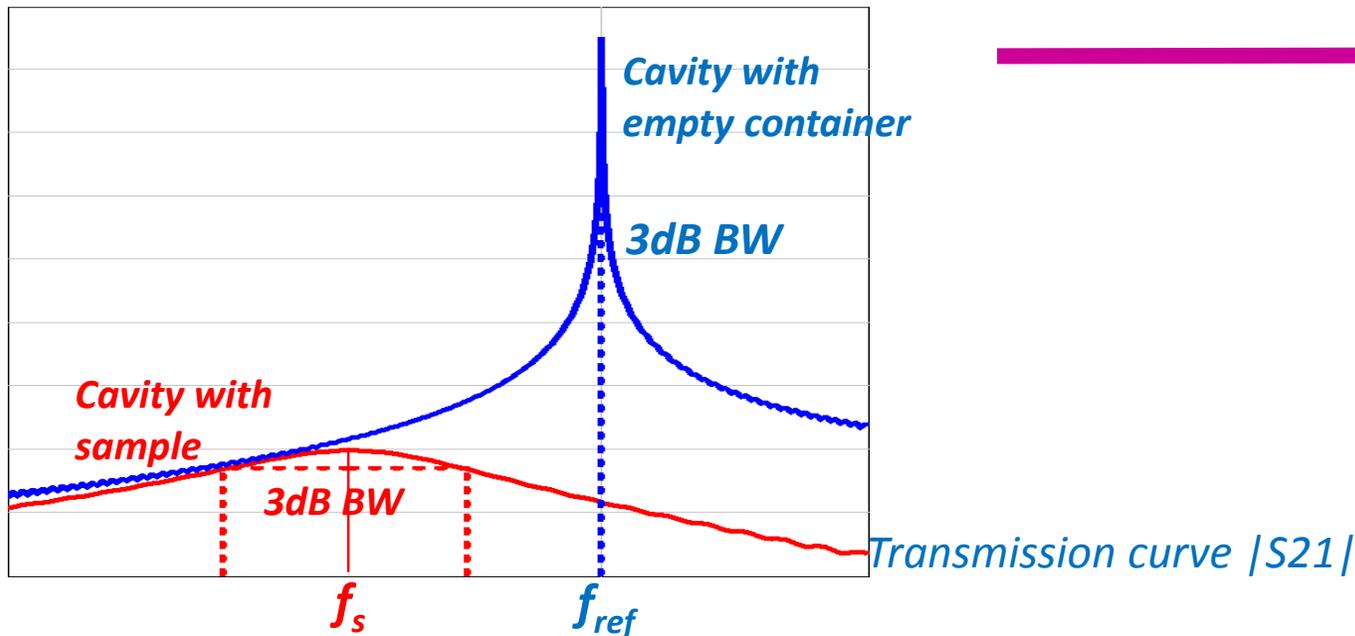

Transmission curve $|S_{21}|$

* Obtained with QuickWave 3D software

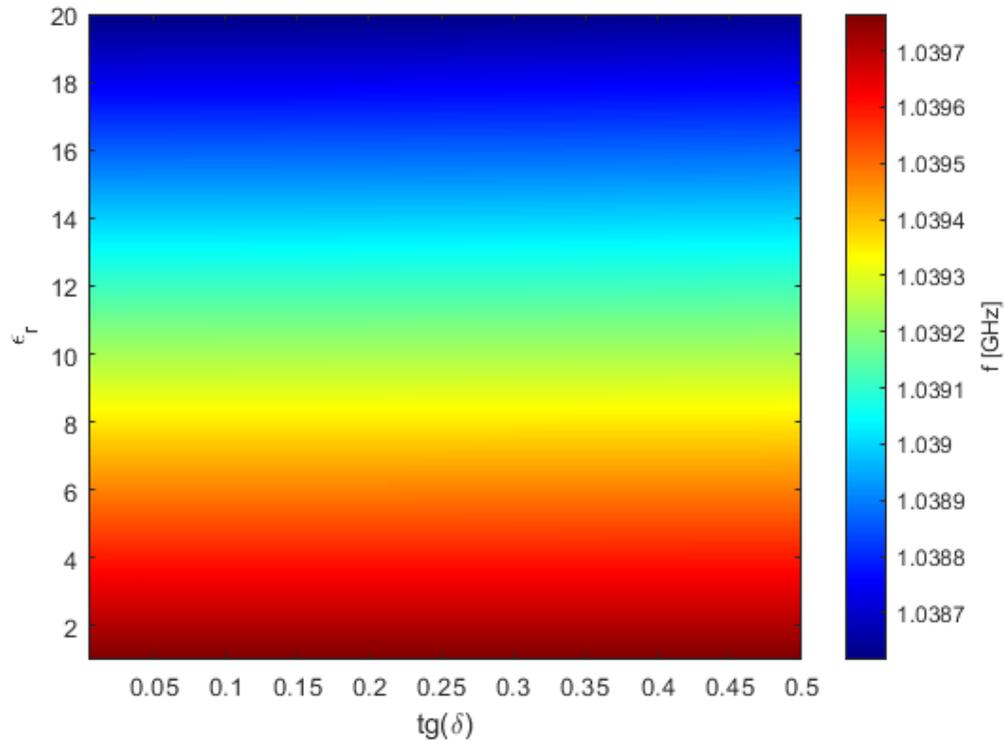

Measurement methods (4)

- Two/three stage measurement
- Reference measurement – cavity with empty container (f_{ref} and Q_{ref})
→ the inner diameter of the container/container needs to be precisely calibrated
- Measurement of sample-loaded cavity (f_s and Q_s)
- Scalar measurement of transmission curve ($|S_{21}|$) is typically sufficient

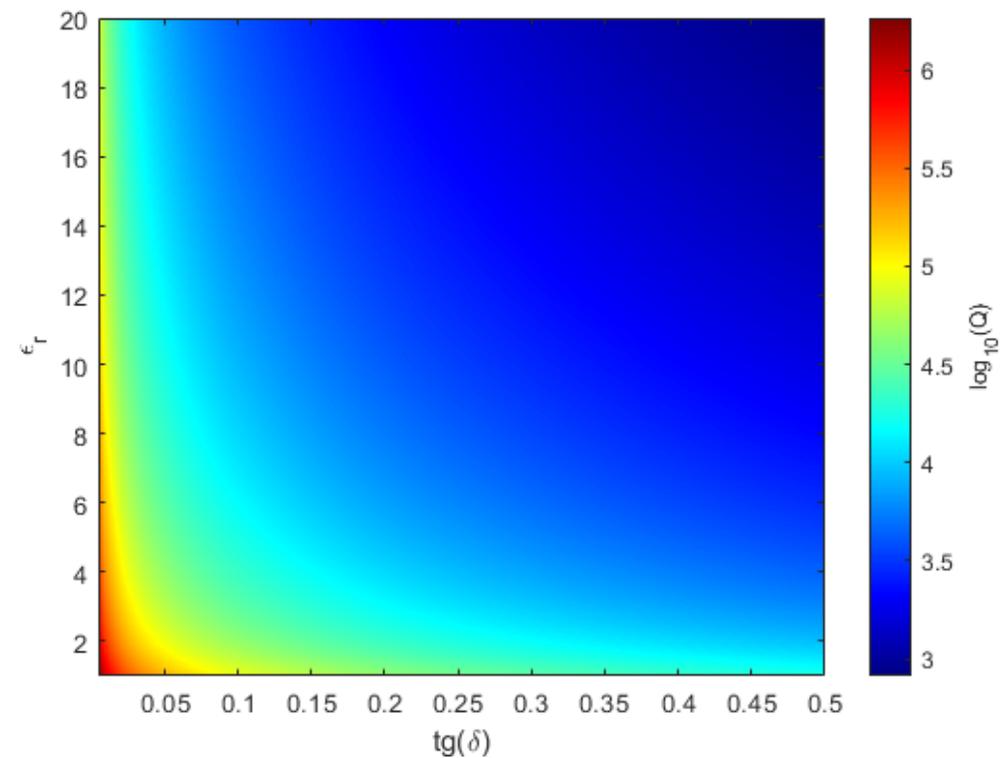

Lookup Tables

In a **low-loss regime**, resonance frequency depends mostly on the Dk ,
whereas the Q-factor decreases with both Dk & Df .

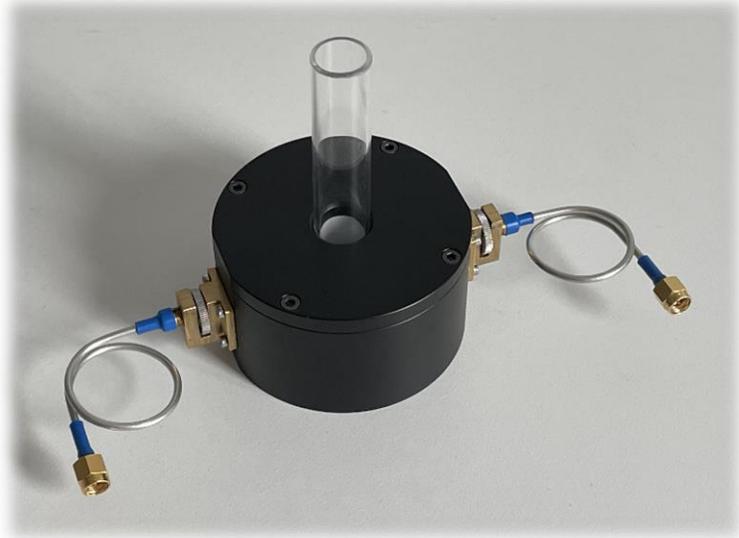

Resonance frequency

Q-factor (log-scale)

Measurement methods (5)

Low frequency dielectric resonator cavities Dielectric resonator cavity at 2.5 GHz

Specification

Fluid diameter < 16 mm

TE_{018} : $f = 2.45$ GHz ($Q = 29,400$)

TE_{028} : $f = 5.16$ GHz ($Q = 27,200$)

Higher frequency cavity resonators 24-GHz Cavity resonator

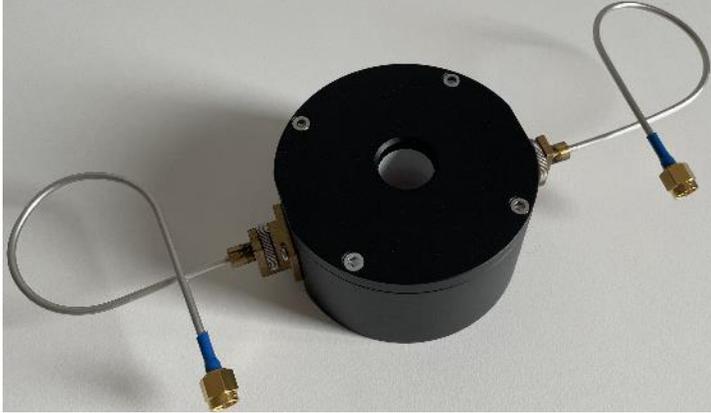

Specification

Fluid diameter < 3 mm

TE_{011} : $f = 23.8$ GHz ($Q = 14,200$)

Measurement methods (5)

Low frequency dielectric resonator cavities Dielectric resonator cavity at 2.5 GHz

Specification

Fluid diameter < 16 mm

TE₀₁₈: $f = 2.45$ GHz (Q = 29,400)

TE₀₂₈: $f = 5.16$ GHz (Q = 27,200)

$f \uparrow$ manufacturing tolerances of FS tubes \uparrow
prohibitively large D_{in} variation

uncertainty of the measurement \uparrow

Higher frequency cavity resonators 24-GHz Cavity resonator

Specification

Fluid diameter < 3 mm

TE₀₁₁: $f = 23.8$ GHz (Q = 14,200)

Fabry-Perot Open Resonator

Dedicated
liquid container

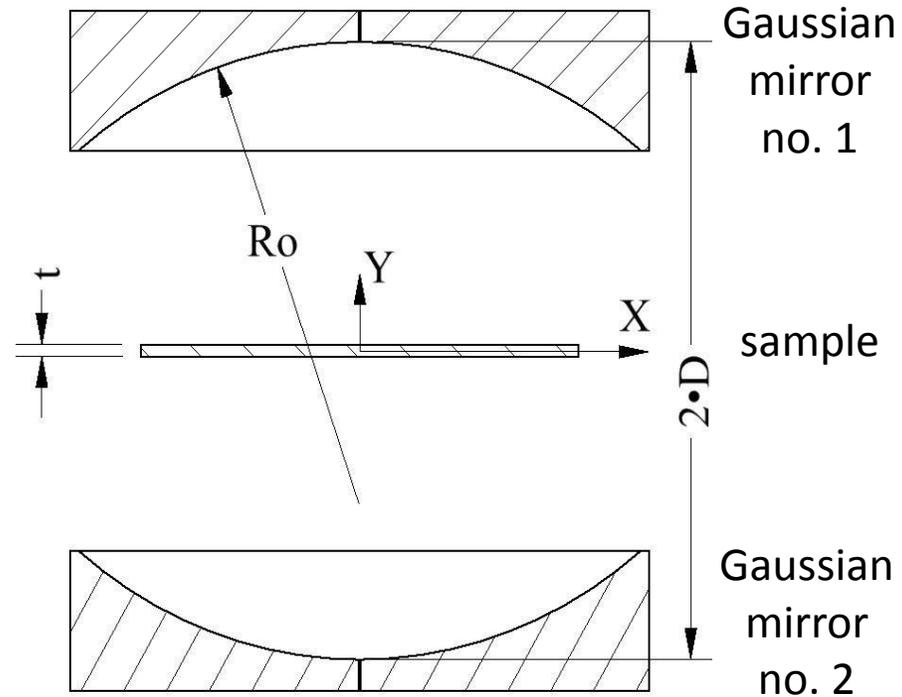

Single solution for 15-50GHz

Fabry-Perot Open Resonator

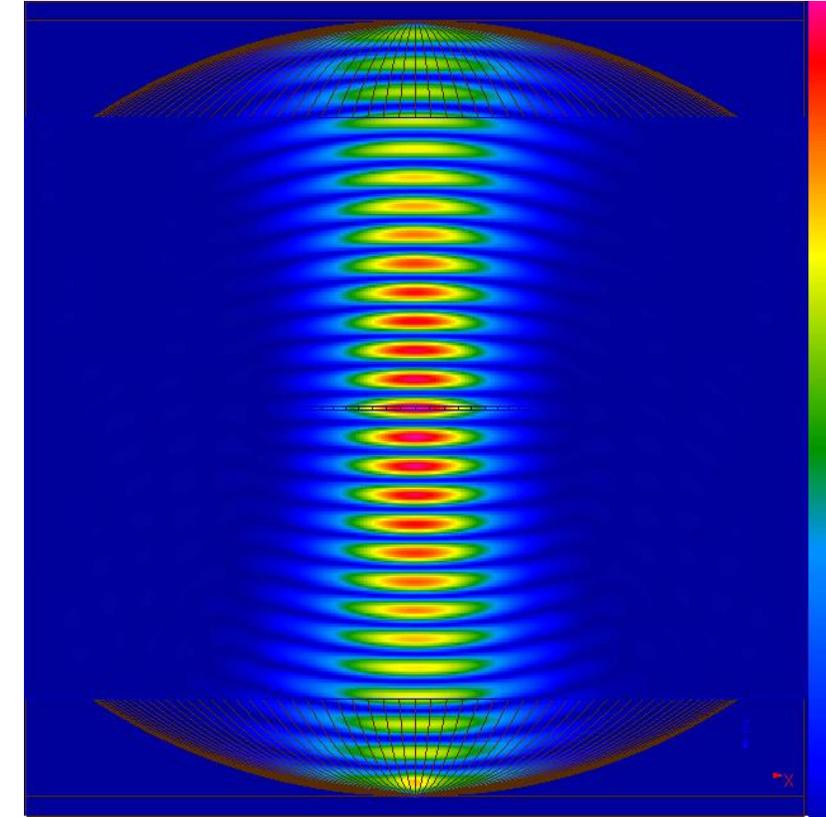

Fabry-Perot Open resonator

Bridging the gap between classical resonant methods and free space methods

Gaussian TEM_{00q} modes

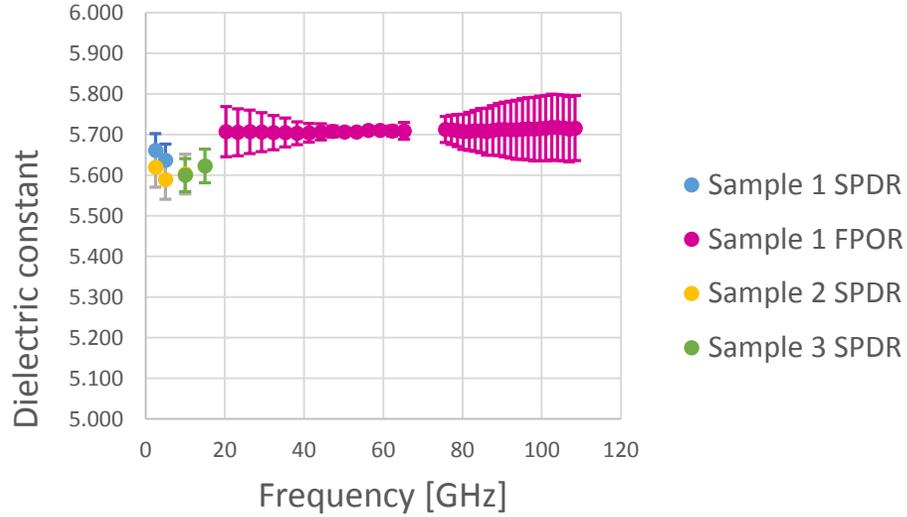

Electric field distribution - simulation model in QuickWave software

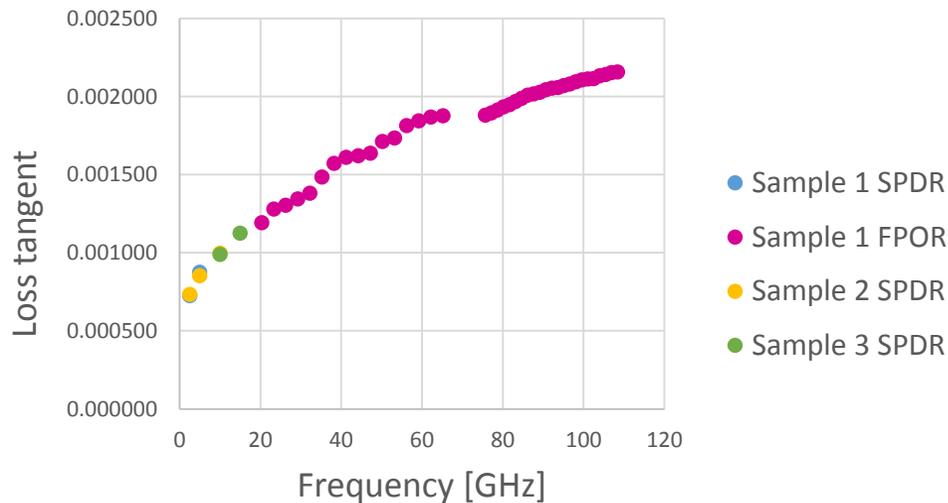

FPOR for sheet dielectrics characterization

LTCC and ULTCC materials' characterisation activities in ULTCC6G_EPac

LTCC material

LTCC material

Wideband FPOR solution

Family of SPDR fixtures

FPOR for fluids characterization

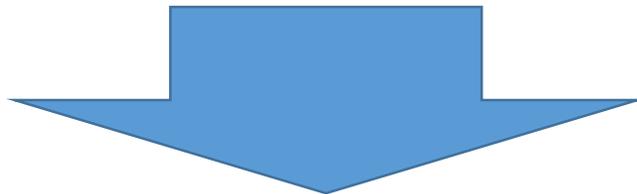

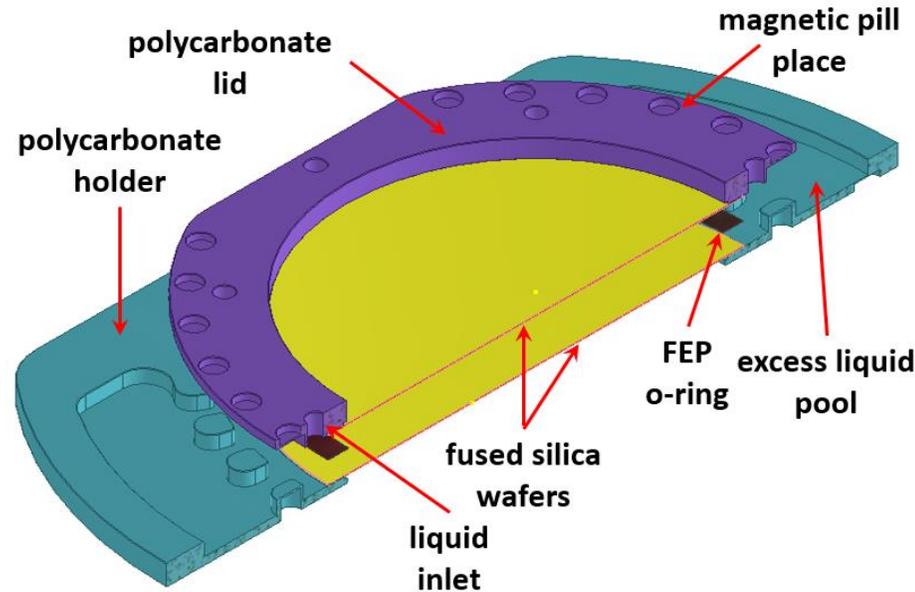

Fabry-Perot open resonator with a dedicated fluid container

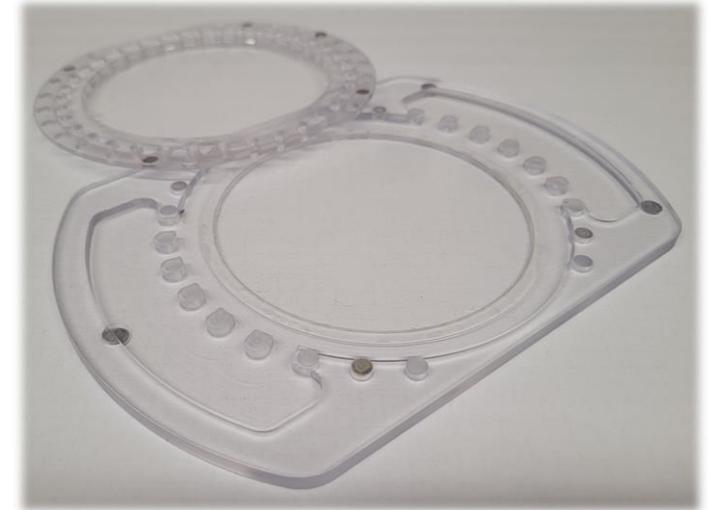

Specification

Fluid thickness: 100-400 μm

Frequency: 15-50 GHz

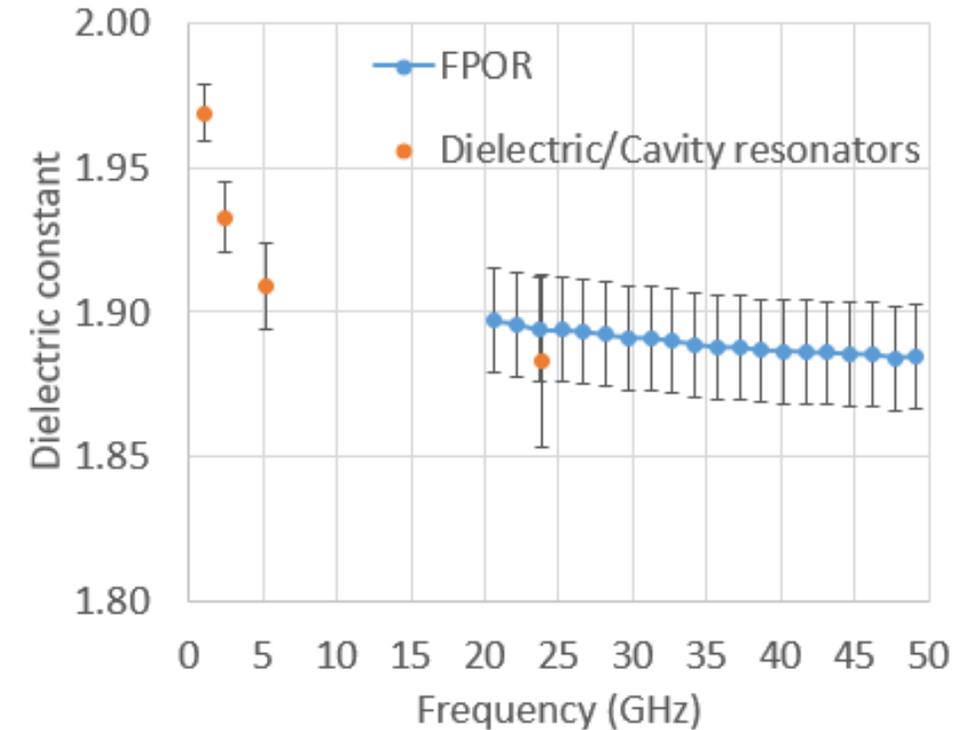

*Requires dedicated EM model
and measurement software*

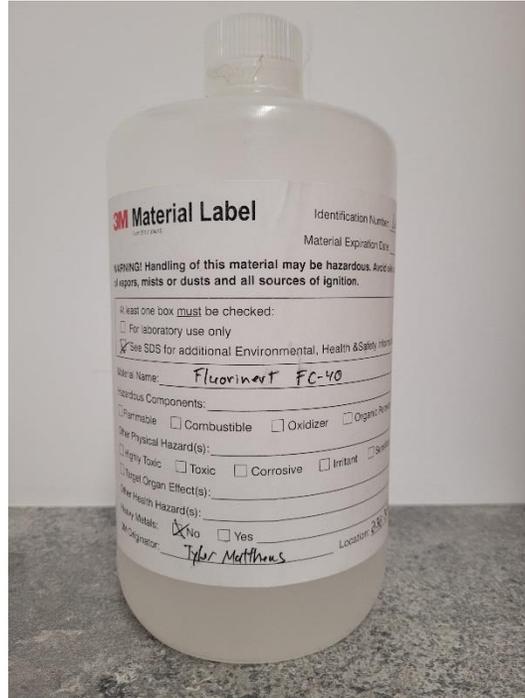

Measurements results - electronic coolants

Low-loss liquids typically exhibit **dispersive properties** at microwaves
(Debye-like relaxation)

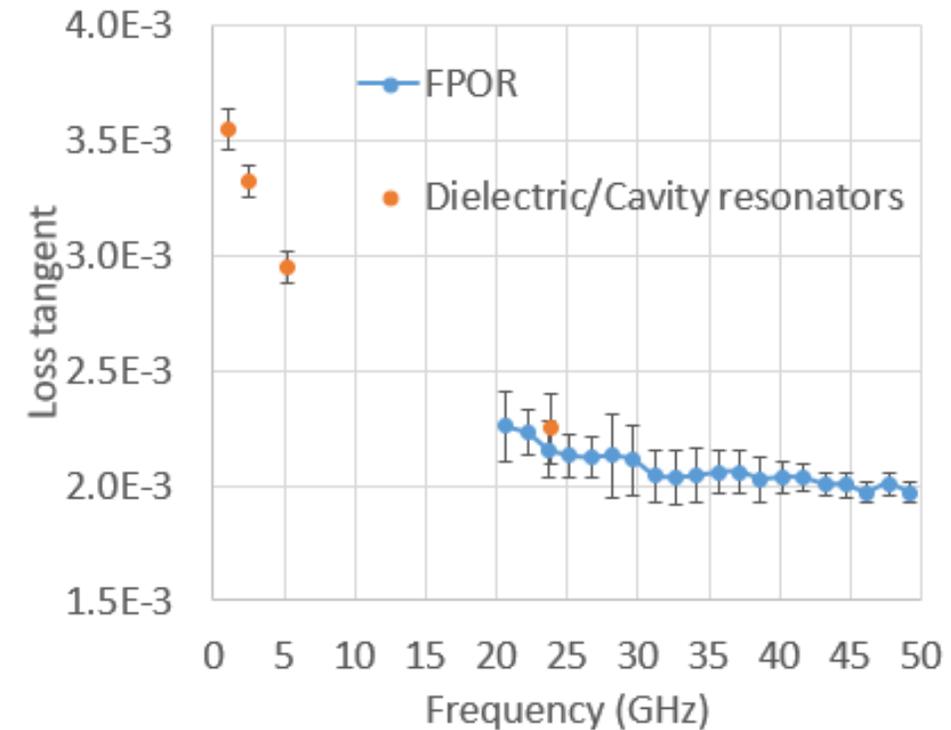

Dielectric constant

Uncertainty of $D_k < 1\%$

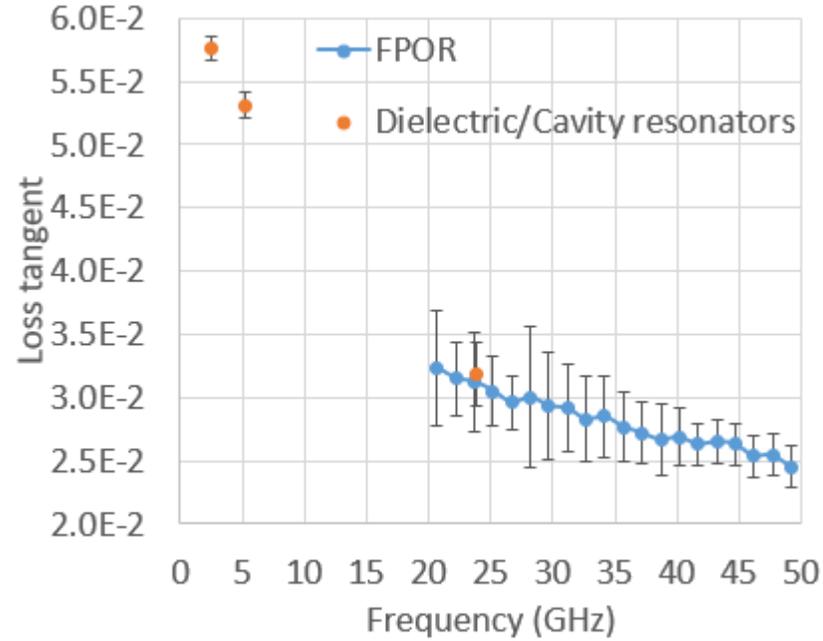

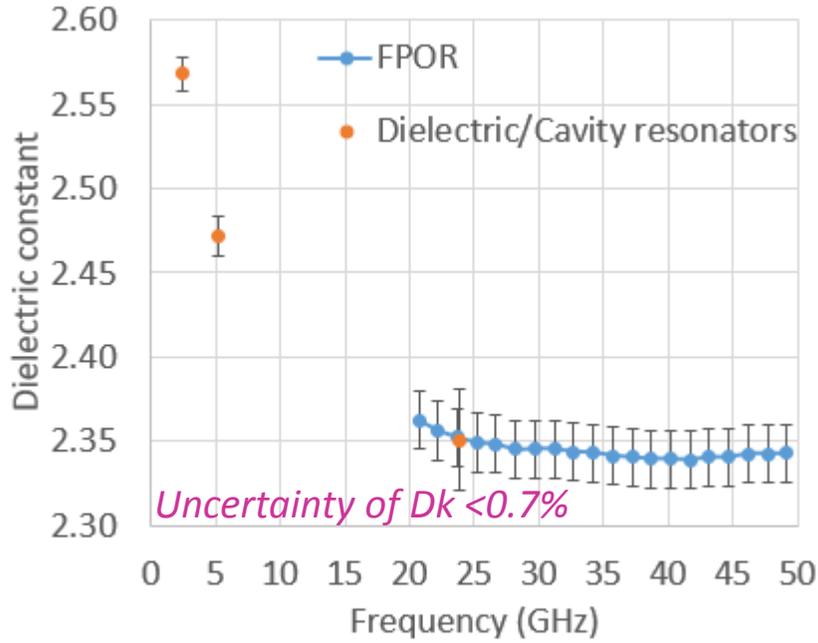

Fluorinert
(3M FC-40)

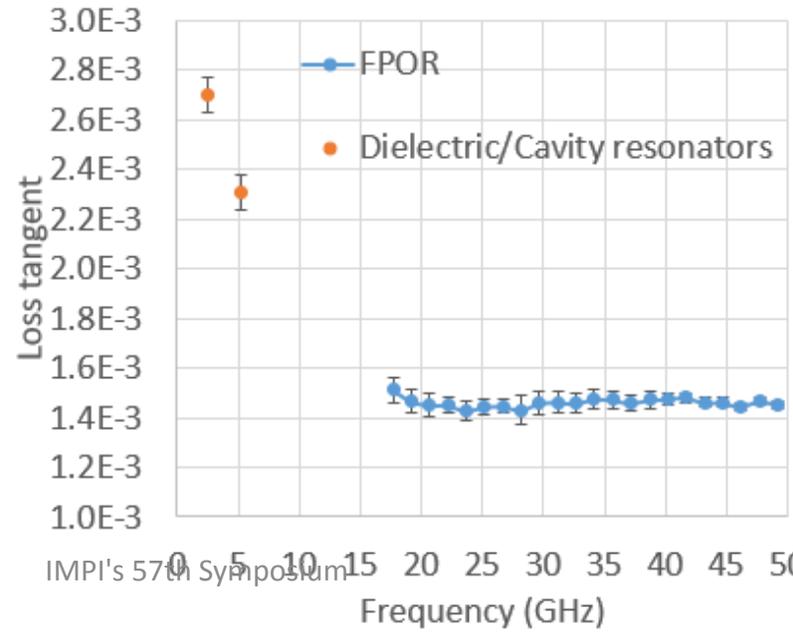

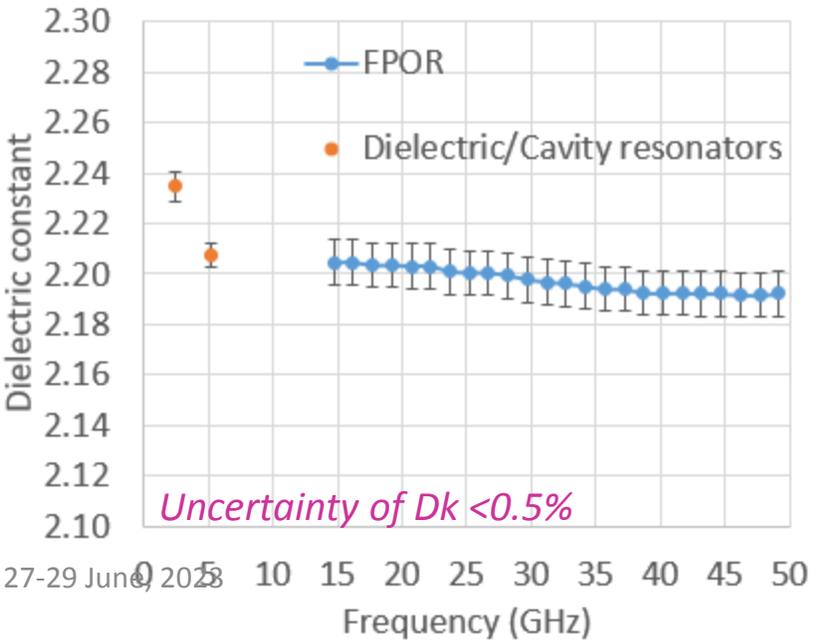

Loss tangent

Measurements results - oils

Canola oil

Engine oil

Temperature measurements (1)

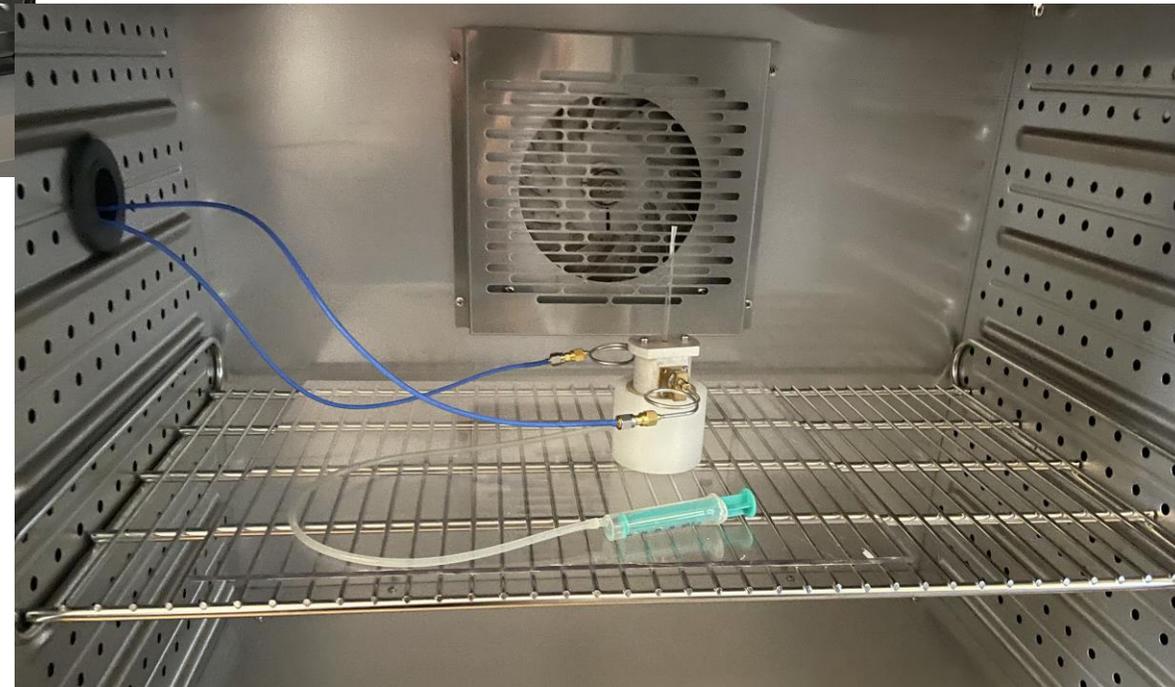

Dielectric characterization versus temperature

PC with
control app

VNA

Climatic chamber
with cavity resonator
@24GHz

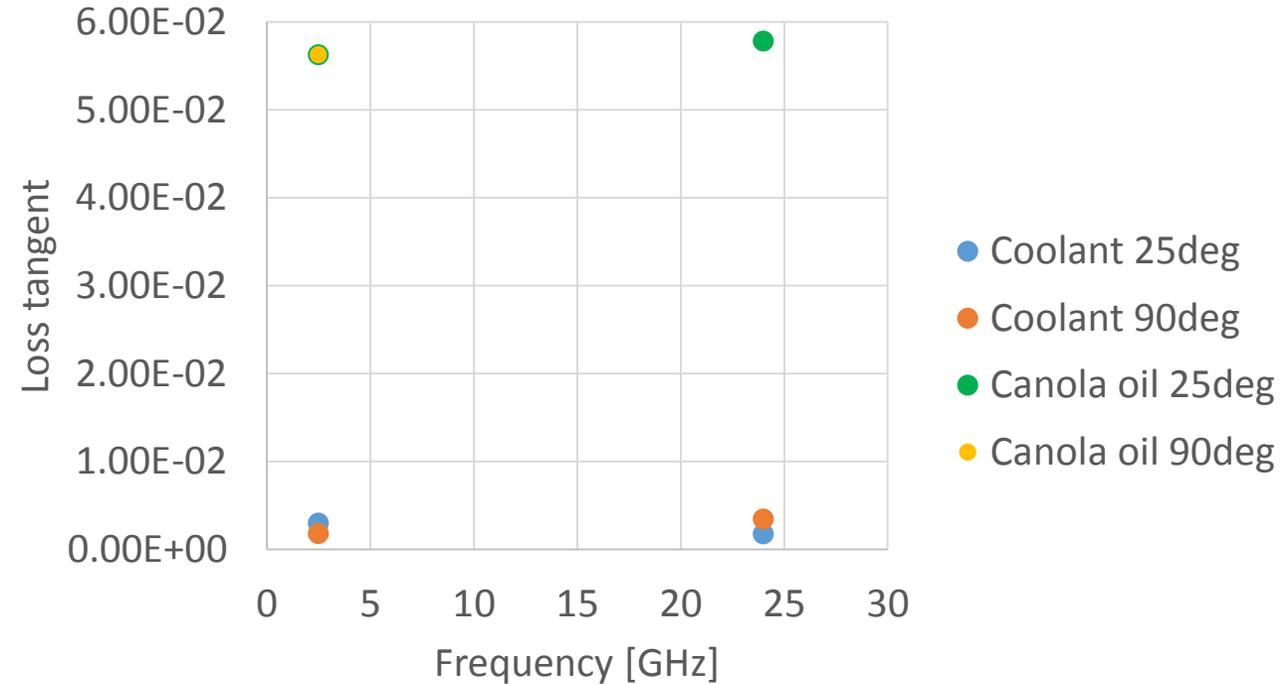

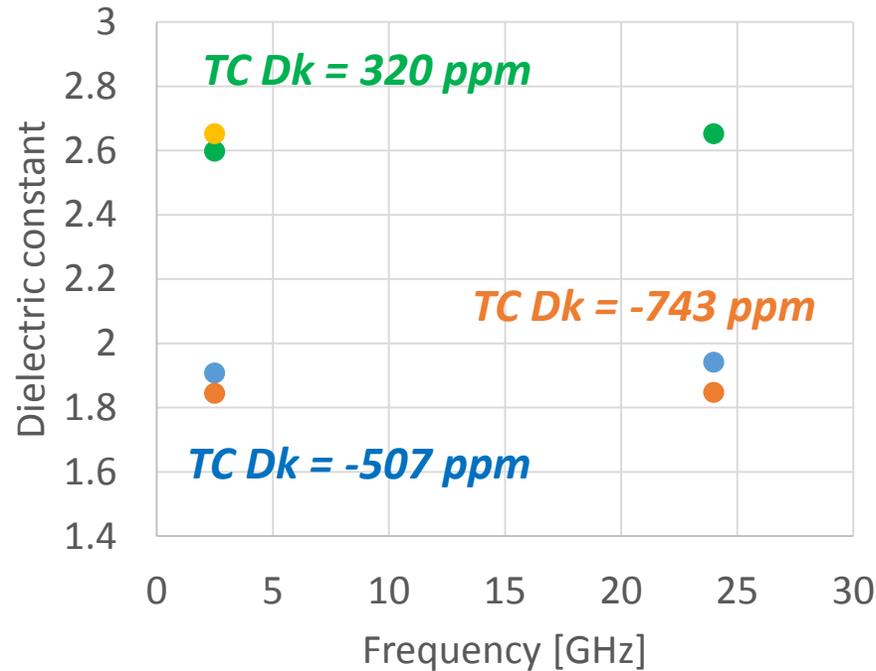

- ✓ **Material parameters versus frequency**
- ✓ **TC of dielectric constant of liquid**

Temperature measurements (2)

Dielectric characterization versus temperature

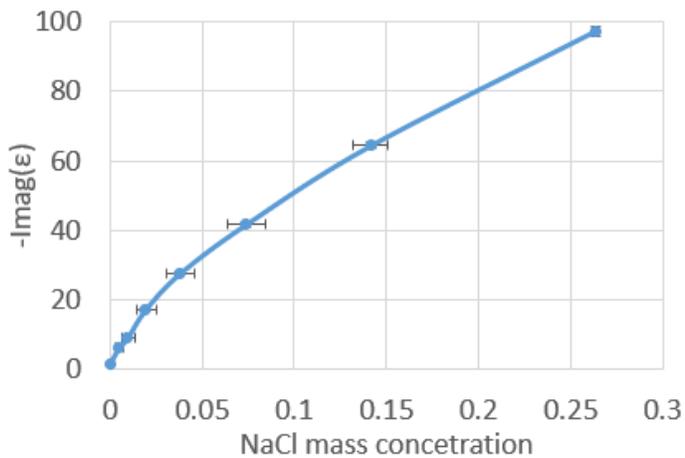

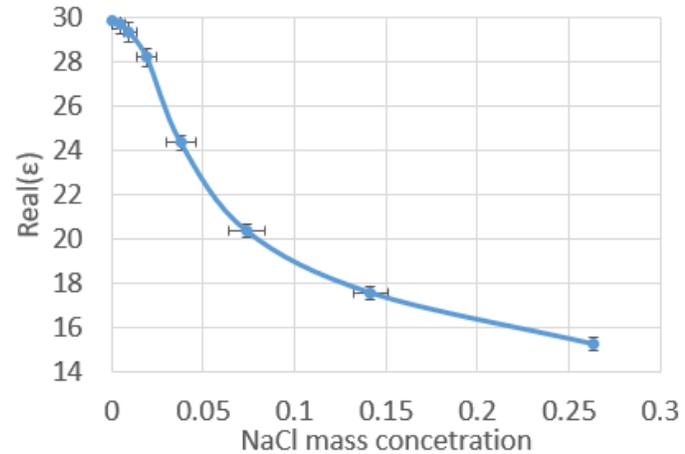

coolant liquid and canola oil

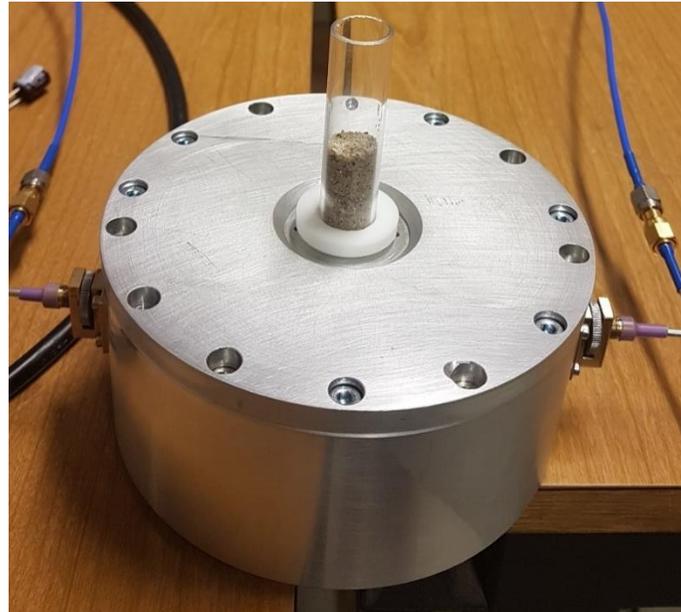

Uncertainty of Dk due to variation of diameter of quartz tube
@2.5 GHz – 0.1% *@24GHz – 0.7%*

Sand and saline water

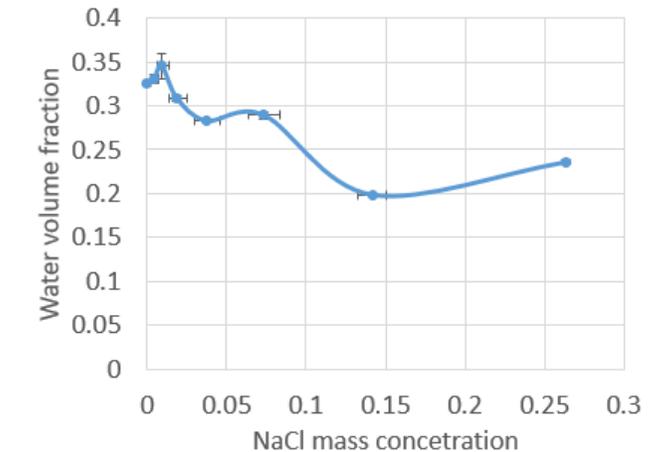

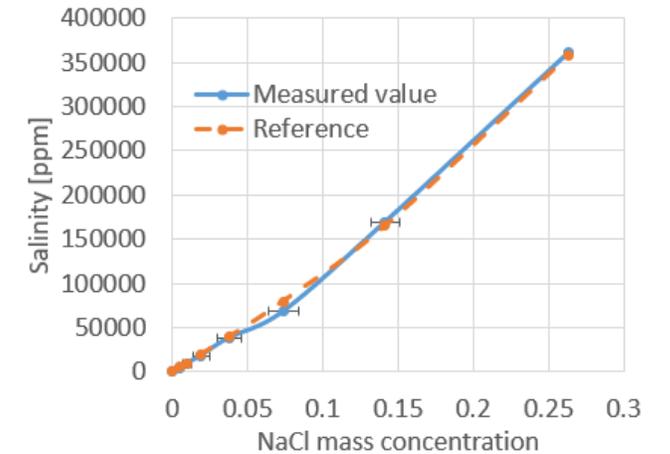

Intrinsic properties of mixture components can be evaluated
(e.g. using Maxwell-Garnett model)

$T = 22\text{ }^{\circ}\text{C}$

Dielectric resonator
(1.04 GHz)

Summary

- Resonant cavity methods for fluids characterisation has been presented and discussed
- New Fabry-Perot open resonator has been presented and applied to liquid materials measurements
- Three liquid materials have been characterised within 1 – 50GHz frequency range
- Good agreement between the methods is observed
- Dielectric/Cavity methods are well applied for temperature measurements and TC extraction
